## Education

2018 - Present (*June 2024 Expected*) University of Chicago Booth School of Business

Ph.D. Economics Candidate

(Primary Thesis Advisors Professors Matthew Notowidigdo & Neale Mahoney)

M.B.A. Candidate (*June 2022 Expected*)

2011 - 2012 University College London

MSc Economic Policy

2008 - 2011 University of Warwick

BSc Economics

## Research Fields

Household Finance, Behavioral Economics, Applied Microeconomics.

## Affiliations

2020 - Present [TE](#) Research Fellow. TE is a UK Research & Innovation (UKRI) funded collaboration between academia and private data providers conducting research and providing real-time, regional data via a dashboard to UK policymakers.

2016 - 2018 Financial Conduct Authority (FCA), Senior Economist

2012 - 2016 Financial Conduct Authority (FCA), Economist

2015 Federal Reserve Bank of New York, Seconded National Expert (from FCA)

2010 Bank of England, Summer Intern

## Research Grants

2020 John and Serena Liew Fellowship Fund at the Fama-Miller Centre for Research in Finance

2019 Chicago Booth PhD Research Grant

## Invited Courses (*Scheduled*)

2022 NBER Behavioral Public Economics Boot Camp - Allcott, Bernheim & Taubinsky.

## Presentations

Federal Reserve Bank of Kansas City Roundtable on Buy Now, Pay Later (BNPL) Lending Regulation 2022 (*Scheduled*), Society for Consumer Psychology (SCP) 2022 Annual Meeting (*Scheduled*), Harvard Kennedy School Roundtable on Buy Now, Pay Later (BNPL) Lending Regulation 2022, Boulder Summer Conference On Consumer Financial Decision Making 2020/21, #EconTwitter Virtual Finance + Economics Conference 2020, Federal Deposit Insurance Corporation (FDIC) Consumer Research Symposium 2019, Consumer Financial Protection Bureau (CFPB) Research Conference 2019, RAND Behavioral Finance (BeFi) Forum 2019, Advances with Field Experiments Conference 2018, , NBER Summer Institute 2016 - Household Finance (co-author presented), Network for Integrated Behavioral Science (NIBS) Conference 2016, University of Essex Seminar 2016, University of Stirling Behavioral Science Workshop 2016, NBER Summer Institute 2015 - Law & Economics (co-author presented), Federal Reserve Bank of New York (FRBNY) Research Seminar 2015.

## Discussant

Allied Social Science Associations (ASSA) 2022 Annual Meeting - American Real Estate & Urban Economics Association (AREUEA).

## Posters

Society for Judgement and Decision Making (SJDM) 2022 Annual Meeting, Allied Social Science Associations (ASSA) 2022 Annual Meeting - American Finance Association (AFA), International Conference on Credit Risk Evaluation: CREDIT 2021 “Compound Risk: Climate, Disaster, Finance, Pandemic”.

## Publications

**Tracking and Stress-Testing U.S. Household Leverage** (2018) With Andreas Fuster and Andrew Haughwout. *Economic Policy Review* 24 (1): 35-63. ([Updated data](#)).

Summarized in [Liberty Street Economics](#) blog

Borrowers’ housing equity is an important component of their wealth and a critical determinant of their vulnerability to shocks. In this paper, we create a unique data set that enables us to provide a comprehensive look at the ratio of housing debt to housing values what we refer to as household leverage at the micro level. An advantage of our data is that we are able to study the evolution of household leverage over time and locations in the United States. We find that leverage was at a very low point just prior to the large declines in house prices that began in 2006, and rose very quickly thereafter, despite reductions in housing debt. As of early 2016, leverage statistics are approaching their pre-crisis levels, as house prices have risen more than 30 percent nationally since 2012. We use our borrower-level leverage measures and another unique feature of our data updated borrower credit scores to conduct ‘stress tests’: projecting leverage and defaults under various adverse house price scenarios. We find that while the riskiness of the household sector has declined significantly since 2012, it remains vulnerable to very severe house price declines.

**How Do Payday Loans Affect Borrowers? Evidence From the U.K. Market** (2019) With John Gathergood and Stefan Hunt. *Review of Financial Studies*, 32 (2): 496-523. Reprinted in [Society for Financial Studies Virtual Issue: Debt](#).

Payday loans are controversial high-cost, short-term lending products, banned in many

U.S. states. But debates surrounding their benefits to consumers continue. We analyze the effects of payday loans on consumers by using a unique data set including 99% of loans approved in the United Kingdom over a two-year period matched to credit files. Using a regression discontinuity research design, our results show that payday loans provide short-lived liquidity gains and encourage consumers to take on additional credit. However, in the following months, payday loans cause persistent increases in defaults and cause consumers to exceed their bank overdraft limits.

**Default Effects of Credit Card Minimum Payments** (2021) With Hiroaki Sakaguchi, Neil Stewart, John Gathergood, Paul Adams, Lucy Hayes and Stefan Hunt.

*Journal of Marketing Research*, December 2021.

Credit card minimum payments are designed to ensure that individuals pay down their debt over time, and scheduling minimum automatic repayments helps to avoid forgetting to repay. Yet minimum payments have additional, unintended psychological default effects by drawing attention away from the card balance due. First, once individuals set the minimum automatic repayment as the default, they then neglect to make the occasional larger repayments they made previously. As a result, individuals incur considerably more credit card interest than late payment fees avoided. Using detailed transaction data, we show that approximately 8% of all of the interest ever paid is due to this effect. Second, manual credit card payments are lower when individuals are prompted with minimum payment information. Two new interventions to mitigate this effect are tested in an experiment, prompting full repayment and prompting those repaying little to pay more, with large counter effects. Hence, shrouding the minimum payment option for automatic and manual payments and directing attention to the full balance may remedy these unintended effects.

**Do Nudges Reduce Borrowing and Consumer Confusion in the Credit Card Market?** (2022) With Paul Adams, Lucy Hayes, Stefan Hunt, David Laibson and Neil Stewart. *NBER Working Paper No. TBC & Economica (Centenary Issue)*, Forthcoming. ([Online Annex](#))

We test the effects of two nudges designed to reduce credit card indebtedness; our study uses field experiments on 183,441 UK credit cardholders. All of the nudges have two components: (i) they explain the negative consequences of making only the minimum required payment and (ii) they recommend and logistically facilitate payments in excess of the minimum required payment. Our first experiment studies nudges that appear on monthly credit card statements. Our second experiment studies letters and email nudges (apart from monthly statements), which are sent to cardholders who have chosen to make automatic minimum payments. Both interventions generate no effect on economic outcomes by the end of our half-year observation period. In a follow-up survey, we find 96% of survey respondents in the control group underestimate the repayment time generated by making only required minimum payments. The nudges substantially reduce the magnitude of this optimistic bias, but the bias remains overwhelmingly common.

## Covid Research

**Trends in Medical Debt During the Covid-19 Pandemic** (2022)

With Ray Kluender, Neale Mahoney, Francis Wong, Xuyang Xia & Wesley Yin.

*Embargoed pre-publication.*

**Levelling Down and the COVID-19 Lockdowns: Uneven Regional Recovery**

[in UK Consumer Spending](#) (2021) With John Gathergood, Fabian Gunzinger, Edika Quispe-Torreblanca & Neil Stewart. *CEPR Covid Economics*, 67: 24-52.

Summarized in [Economics Observatory](#) and [Chicago Booth Review](#).

We show the recovery in consumer spending in the United Kingdom through the second half of 2020 is unevenly distributed across regions. We utilise Fable Data: a real-time source of consumption data that is a highly correlated, leading indicator of Bank of England and Office for National Statistics data. The UK's recovery is heavily weighted towards the "home counties" around outer London and the South. We observe a stark contrast between strong online spending growth while offline spending contracts. The strongest recovery in spending is seen in online spending in the "commuter belt" areas in outer London and the surrounding localities and also in areas of high second home ownership, where working from home (including working from second homes) has significantly displaced the location of spending. Year-on-year spending growth in November 2020 in localities facing the UK's new tighter "Tier 3" restrictions (mostly the midlands and northern areas) was 38.4% lower compared with areas facing the less restrictive "Tier 2" (mostly London and the South). These patterns had been further exacerbated during November 2020 when a second national lockdown was imposed. To prevent such COVID-19-driven regional inequalities from becoming persistent we propose governments introduce temporary, regionally-targeted interventions in 2021. The availability of real-time, regional data enables policymakers to efficiently decide when, where and how to implement such regional interventions and to be able to rapidly evaluate their effectiveness to consider whether to expand, modify or remove them.

[The English Patient: Evaluating Local Lockdowns Using Real-Time COVID-19 & Consumption Data](#) (2021) With John Gathergood. *CEPR Covid Economics*, 64: 73-100. Summarized in [Economics Observatory](#) and [Chicago Booth Review](#).

We find UK "local lockdowns" of cities and small regions, focused on limiting how many people a household can interact with and in what settings, are effective in turning the tide on rising positive COVID-19 cases. Yet, by focusing on household mixing within the home, these local lockdowns have not inflicted the large declines in consumption observed in March 2020 when the first virus wave and first national lockdown occurred. Our study harnesses a new source of real-time, transaction-level consumption data that we show to be highly correlated with official statistics. The effectiveness of local lockdowns are evaluated applying a difference-in-difference approach which exploits nearby localities not subject to local lockdowns as comparison groups. Our findings indicate that policymakers may be able to contain virus outbreaks without killing local economies. However, the ultimate effectiveness of local lockdowns is expected to be highly dependent on co-ordination between regions and an effective system of testing.

## Working Papers

[Buy Now, Pay Later \(BNPL\)...On Your Credit Card](#) (2022) With Chris Firth and John Gathergood.

We document growing consumer use of 'buy now, pay later' (BNPL): an unregulated Fin-Tech credit product enabling consumers to defer payments interest-free into instalments. In 2021 a BNPL instalment is charged to 19.5% of active credit cards in our UK data. We estimate 40-50% of all BNPL is charged to credit cards. Charging a 0% interest, amortizing BNPL debt to credit cards, where typical interest rates are 20% and amortization schedules decades-long, raises doubts on consumers' ability to pay for BNPL. Such charg-

ing of BNPL to credit cards is most prevalent among younger consumers and in the most deprived geographies.

### **The Semblance of Success in Nudging Consumers to Pay Down Credit Card Debt** (2021) With Paul Adams, Stefan Hunt, David Laibson and Neil Stewart.

We study how consumer responses to a nudge counteract its intended effect to reduce credit card debt. The nudge shrouds the option to automatically pay only the contractual minimum & increases the salience of a payment option to automatically amortize debt faster. Despite the intervention causing large proximate effects – increasing enrollment to this salient payment option 21 percentage points & reducing the likelihood of only paying the minimum by 7 percentage points – it has no distal effects on debt. Results are explained by three offsetting consumer responses: (i) Automatic payment amounts selected often bind at the contractual minimum or are small amounts above it, (ii) Automatic payment enrollment decreases – increasing missed payments, and (iii) Manual payments decrease.

### **Weighing Anchor on Credit Card Debt** (2018) With Jesse Leary and Neil Stewart.

We find it is common for consumers who are not in financial distress to make credit card payments at or close to the minimum. This pattern is difficult to reconcile with economic factors but can be explained by minimum payment information presented to consumers acting as an anchor that weighs payments down. Building on Stewart (2009), we conduct a hypothetical credit card payment experiment to test an intervention to de-anchor payment choices. This intervention effectively stops consumers selecting payments at the contractual minimum. It also increases their average payments, as well as shifting the distribution of payments. By de-anchoring choices from the minimum, consumers increasingly choose the full payment amount which potentially seems to act as a target payment for consumers. We innovate by linking the experimental responses to survey responses on financial distress and to actual credit card payment behaviours. We find that the intervention largely increases payments made by less financially-distressed consumers. We are also able to evaluate the potential external validity of our experiment and find that hypothetical responses are closely related to consumers' actual credit card payments.

## **Selected Works-in-Progress**

### **Flag Tag: Credit File Disaster Flags As Social Insurance Tags**

(Poster Summary)

This paper finds 59.2 million people had a ‘disaster flag’ on their US credit file (2010 - 2020) with broad geographical use during the COVID-19 pandemic. Disaster flags mask adverse credit file data with the aim of protecting credit access following disasters such as hurricanes & wildfires. Flags are voluntarily applied by lenders to borrowers' credit files. I describe the selection of lenders and borrowers into applying these flags over twenty years and estimate the effects of flags on credit access using a difference-in-difference design. There is adverse selection into flag use: people using flags are ex-ante riskier and defaults masked by flags are riskier than non-flagged defaults. Among those selecting into flags, I find small average effects of flags on credit scores (1.5-2pp) driven by larger (10-15pp), temporary effects for those with pre-disaster defaults or subprime credit scores. Finally, the paper considers a counterfactual social insurance regime automatically masking all new defaults during natural disasters and finds doing so would have limited predictive loss.

### **A Share Too Far: How Data Innovation Unraveled U.S. Credit Card**

**Information Sharing** With Andrés Shahidinejad.

We study the consequences of a credit reporting innovation that enhanced the value of credit file data to US credit card lenders. The reporting innovation (“trended data”) allowed lenders to observe a history of repayment behavior on each credit card, as opposed to only one month’s repayment amount. This paper analyzes lenders’ incentives to share data around this innovation and the consequences of resulting changes in data sharing upon individuals’ finances.

We document that this credit reporting innovation led to the unravelling of the data sharing equilibrium, with 50% of US credit cards no longer reporting payment information to credit bureaus. The unraveling of information sharing is inefficient because it increases informational asymmetries between borrowers and lenders.

The selection of credit card lenders who stop reporting appears consistent with them having more market power and therefore more to lose from increased competition than other lenders. Lenders who stop reporting have a portfolio of borrowers with \$90 (13%) higher spending each month and 13% more likely to repay debt in full than lenders who kept reporting. Without payment information, the borrowers at lenders who stop reporting appear less profitable and riskier than they actually are.

Using a difference-in-difference design, we test the effects of this unraveling on household credit access by comparing individuals whose information stopped being reported with individuals whose information was always or never reported. While the choice of lenders to stop reporting is endogenous, it yields an exogenous source of exposure across cardholders because they cannot anticipate the event. Our preliminary results suggest that the effects of the unraveling of data sharing on credit card credit limits and household borrowing are small. On-going work is investigating effects on implied costs of borrowing.

### **Evaluating Hard Paternalistic Financial Regulation: Evidence from Tightening Credit Card Minimum Payment Requirements in Quebec**

With Jason Allen & Michael Boutros.

### **A Guide to Consumer Credit File Data For Academic Research**

With Christa Gibbs, Donghoon Lee, Scott Nelson, Wilbert Van der Klauuw & Jialan Wang.

## Data Partners

These organizations share data with me for research (n.b. others may do so anonymously):

- [Fable Data](#)
- [Huq](#)
- [TransUnion](#) (via [Kilts Center for Marketing](#))

## Data Assets Created

- Co-created (with Tom Crossley, Annette Jäckle & Jesse Leary) credit file data merged with the existing UK nationally-representative longitudinal household panel (Understanding Society). Collaboration between the Financial Conduct Authority, the Institute for Social and Economic Research (ISER) at the University of Essex and Economic and Social Research Council (ESRC). Version of merged data scheduled to be publicly deposited on UK Data Archive.
- Created dataset of UK credit cards to evaluate effects of series of field experiments for regulatory use by Financial Conduct Authority. These credit card data were merged with credit files as well as an accompanying consumer survey (which I also designed).
- Created the first panel of UK credit file data for regulatory use by Financial Conduct Authority & Bank of England. This was designed as a UK version of the Federal Reserve Bank of New York's Consumer Credit Panel.
- Designed 2016 consumer survey of UK payday lending market for regulatory use by Financial Conduct Authority.
- Co-created (with John Gathergood & Stefan Hunt) dataset of UK payday lending market (2012 - 2018) covering loan applications and originations and merged to credit files for regulatory use by Financial Conduct Authority.
- Designed (with Alessandro Nava, John Gathergood & Stefan Hunt) 2014 consumer survey of UK payday lending market for regulatory use by Financial Conduct Authority.

## Policy Research

On-going advice to and collaborations with UK policymakers (Bank of England, Her Majesty's Treasury, Department for Business, Energy & Industrial Strategy, Cabinet Office, Office for National Statistics) through role as a [TE](#) Research Fellow. [TE](#) is a UK Research & Innovation (UKRI) funded collaboration between academia and private data providers conducting research and providing real-time, regional data via a dashboard to UK policymakers. Latest public work updated at: [tracktheeconomy.ac.uk](https://tracktheeconomy.ac.uk).
