

Targeting Higher Credit Card Payments

Benedict Guttman-Kenney

Rice University

Rice Finance Brownbag, 6th February 2026

Credit Cardholders Often Pay At Or Near Minimum Payment. Why?

(Consumer Financial Protection Bureau, 2025)

- 29% of accounts pay at or near the minimum payment

(Keys & Wang, 2019 JFE)

One Potential Explanation: Anchoring Heuristic

Anchoring & adjustment heuristic: Foundational bias in Tversky & Kahneman (1974)

Key idea:

- Anchors: Salient numbers that can bias consumer choices.
- Consumers choose at / near numerical amount initially presented, & adjust away too little.

“One of the most robust phenomena studied across the social behavioral sciences.”

- 50 year meta-analysis (Schley and Weingarten, 2025)

Anchoring Influential In The Credit Card Literature

Research across the fields of economics, finance, management, marketing, and psychology documents **“credit card anchoring”**

- Credit card minimum payment “can serve as an anchor, and as a nudge that this minimum payment is an appropriate amount” (Sunstein & Thaler, 2008)

Anchoring Influential In The Credit Card Literature

Research across the fields of economics, finance, management, marketing, and psychology documents **“credit card anchoring”**

- Credit card minimum payment “can serve as an anchor, and as a nudge that this minimum payment is an appropriate amount” (Sunstein & Thaler, 2008)
- Shrouding minimum payment amount ↑ hypothetical credit card payments (Stewart, 2009)

Anchoring Influential In The Credit Card Literature

Research across the fields of economics, finance, management, marketing, and psychology documents **“credit card anchoring”**

- Credit card minimum payment “can serve as an anchor, and as a nudge that this minimum payment is an appropriate amount” (Sunstein & Thaler, 2008)
- Shrouding minimum payment amount ↑ hypothetical credit card payments (Stewart, 2009)
- Replicated across online experiments (Navarro-Martinez et al., 2011; Jiang & Dunn, 2013; Salisbury, 2014; McHugh & Ranyard, 2016; Guttman-Kenney et al., 2018; Salisbury & Zhao, 2020; Hendy et al., 2021; Sakaguchi et al., 2022; Ortiz et al., 2024)

Anchoring Influential In The Credit Card Literature

Research across the fields of economics, finance, management, marketing, and psychology documents **“credit card anchoring”**

- Credit card minimum payment “can serve as an anchor, and as a nudge that this minimum payment is an appropriate amount” (Sunstein & Thaler, 2008)
- Shrouding minimum payment amount ↑ hypothetical credit card payments (Stewart, 2009)
- Replicated across online experiments (Navarro-Martinez et al., 2011; Jiang & Dunn, 2013; Salisbury, 2014; McHugh & Ranyard, 2016; Guttman-Kenney et al., 2018; Salisbury & Zhao, 2020; Hendy et al., 2021; Sakaguchi et al., 2022; Ortiz et al., 2024)
- Support for anchoring from studies of credit card administrative data (Keys & Wang, 2019; Medina, & Negrin, 2022; Vihriälä 2025)
 - Guttman-Kenney et al. (2025) shows anchoring does not explain autopay choices

Anchoring Influential In The Credit Card Literature

Research across the fields of economics, finance, management, marketing, and psychology documents **“credit card anchoring”**

- Credit card minimum payment “can serve as an anchor, and as a nudge that this minimum payment is an appropriate amount” (Sunstein & Thaler, 2008)
- Shrouding minimum payment amount ↑ hypothetical credit card payments (Stewart, 2009)
- Replicated across online experiments (Navarro-Martinez et al., 2011; Jiang & Dunn, 2013; Salisbury, 2014; McHugh & Ranyard, 2016; Guttman-Kenney et al., 2018; Salisbury & Zhao, 2020; Hendy et al., 2021; Sakaguchi et al., 2022; Ortiz et al., 2024)
- Support for anchoring from studies of credit card administrative data (Keys & Wang, 2019; Medina, & Negrin, 2022; Vihriälä 2025)
 - Guttman-Kenney et al. (2025) shows anchoring does not explain autopay choices

Key implication: Without anchoring, cardholders would ↑ credit card payments

This Paper: Do Online Experimental Findings Extrapolate To The Field?

Field experiment on 6,714 credit cardholders with a U.S. FinTech lender

- RCT varying in-app credit card payment options
 - Test shrouding minimum payment amount
 - Test adding 50% payment amount option
- Observe outcomes for six cycles

This Paper: Do Online Experimental Findings Extrapolate To The Field?

Field experiment on 6,714 credit cardholders with a U.S. FinTech lender

- RCT varying in-app credit card payment options
 - Test shrouding minimum payment amount
 - Test adding 50% payment amount option
- Observe outcomes for six cycles

Key Findings: Results of hypothetical online experiments do not translate into the field

- No increase in payments from shrouding the minimum payment
- Adding 50% payment option does not increase payments

Contributions

- Evidence that a **policy** shrouding the minimum payment is expected to be ineffective
 - (Financial Conduct Authority, 2021; Brookings, 2022; Financial Health Network, 2023)

Contributions

- Evidence that a **policy** shrouding the minimum payment is expected to be ineffective
 - (Financial Conduct Authority, 2021; Brookings, 2022; Financial Health Network, 2023)
- **Household Finance:** Why do consumers often only pay at/just above the minimum?
 - *Not* driven by heuristic anchoring to the minimum payment
 - Cardholders frequently lack liquid cash (but not at borrowing constraint)

Contributions

- Evidence that a **policy** shrouding the minimum payment is expected to be ineffective
 - (Financial Conduct Authority, 2021; Brookings, 2022; Financial Health Network, 2023)
- **Household Finance:** Why do consumers often only pay at/just above the minimum?
 - *Not* driven by heuristic anchoring to the minimum payment
 - Cardholders frequently lack liquid cash (but not at borrowing constraint)
 - Target paying at least the minimum payment, which acts as a reference point
 - Bunching makes sense given discontinuity in costs at minimum

Contributions

- Evidence that a **policy** shrouding the minimum payment is expected to be ineffective
 - (Financial Conduct Authority, 2021; Brookings, 2022; Financial Health Network, 2023)
- **Household Finance:** Why do consumers often only pay at/just above the minimum?
 - *Not* driven by heuristic anchoring to the minimum payment
 - Cardholders frequently lack liquid cash (but not at borrowing constraint)
 - Target paying at least the minimum payment, which acts as a reference point
 - Bunching makes sense given discontinuity in costs at minimum
- **Behavioral Economics/Finance:** Weakness of active choice nudges & anchoring heuristic

Contributions

- Evidence that a **policy** shrouding the minimum payment is expected to be ineffective
 - (Financial Conduct Authority, 2021; Brookings, 2022; Financial Health Network, 2023)
- **Household Finance:** Why do consumers often only pay at/just above the minimum?

T1 (vs T2): Effect of *adding* 50% option (conditional on shrouding minimum)

Data Provider

U.S. FinTech lender providing credit cards:

- Means: \$290 credit limits, \$200 statement balance, 560 VantageScore.

Below prime (< 660 VantageScore) consumers:

- Group most likely to pay at/near minimum payment, with similar “anchoring” behavior to prime consumers Keys & Wang (2019)
- Group with highest interest rates $\rightarrow$ largest potential gains from $\uparrow$ payments (Drechsler et al., 2025; Consumer Financial Protection Bureau, 2025)

Data Provider

U.S. FinTech lender providing credit cards:

- Group with highest interest rates $\rightarrow$ largest potential gains from $\uparrow$ payments (Drechsler et al., 2025; Consumer Financial Protection Bureau, 2025)

Datasets

Linked lender's administrative credit card data with (1) Clickstream data on payment choices, (2) Financial transaction data on liquid cash (Plaid), (3) Equifax credit reporting data

Today, focus on regression results from dynamic specification:

$$Y_{i,t} = \sum_{\tau=0}^6 \left[\delta_{\tau}^{T1(vsC)} (D_{\tau} \times T1_i) + \delta_{\tau}^{T2(vsC)} (D_{\tau} \times T2_i) \right] + X_i' \beta + \mu_t + \varepsilon_{i,t} \quad (1)$$

- X_i vector of pre-experiment controls, μ_t statement cycle fixed effects
- Standard errors clustered at consumer-level

Today, focus on regression results from dynamic specification:

$$Y_{i,t} = \sum_{\tau=0}^6 \left[\delta_{\tau}^{T1(vsC)} (D_{\tau} \times T1_i) + \delta_{\tau}^{T2(vsC)} (D_{\tau} \times T2_i) \right] + X_i' \beta + \mu_t + \varepsilon_{i,t} \quad (1)$$

- X_i vector of pre-experiment controls, μ_t statement cycle fixed effects
- Standard errors clustered at consumer-level

Pooled specification to $\uparrow$ power:

$$Y_{i,t} = \delta^{T1(vsC)} T1_i + \delta^{T2(vsC)} T2_i + X_i' \beta + \mu_t + \varepsilon_{i,t} \quad (2)$$

2. Experimental Results

Payment Distribution Shows Little Overall Change After 6 Cycles

Field Experiment Results In Sharp Contrast To Online Experiments

Field Experiment (This Paper)

Online Experiment Example (Guttman-Kenney, 2024)

↑ 12.4*** p.p. (s.e. 0.8)
($N = 7,938$, mean 28.1%)

Field Experiment Results In Sharp Contrast To Online Experiments

Field Experiment (This Paper)

Online Experiment Example (Guttman-Kenney, 2024)

↑ 12.4*** p.p. (s.e. 0.8)
($N = 7,938$, mean 28.1%)

Challenging for online experiments to recreate the frictions, intertemporal dynamics, & high-stakes incentives that consumers experience managing their finances.

Effects On Primary Outcome: Payments (% Statement Balance)

δ_6^k (percentage points, C mean: 27.8%):

T1 (vs C) -1.26 (s.e. 1.23) **T2 (vs C)** -0.54 (s.e. 1.19) **T1 (vs T2)** -0.72 (s.e. 1.53)

Effects on Payments (% Statement Balance) Pooled Across Cycles 0 to 6

Comparison	Pooled (δ^k)			
	(1)	(2)	(3)	(4)

(percentage points, C mean: 34.6%)

Other Outcomes & Initial Payment Choices

No Significant $\uparrow$ Payments (\$) Or $\downarrow$ Revolving Debt (\$)

A. Payments (\$)

δ_6^k (percentage points):

T1 (vs C) $-\$9.41^*$ (s.e. \$3.32)

T2 (vs C) $-\$1.95$ (s.e. \$3.65)

T1 (vs T2) $-\$7.36$ (s.e. \$4.38)

(C mean: \$58.4)

B. Revolving Debt (\$)

T1 (vs C): $\$10.76^*$ (s.e. \$5.32)

T2 (vs C): $\$8.79$ (s.e. \$5.14)

T1 (vs T2): $\$1.97$ (s.e. \$6.68)

(C mean: \$230.9)

Effects On Payment Distribution: 29% Less Likely To Only Pay The Minimum

δ_6^k (percentage points, C mean: 15.6%):

T1 (vs C) -4.60*** (s.e. 1.09) **T2 (vs C)** -4.34*** (s.e. 1.06) **T1 (vs T2)** -0.26 (s.e. 1.32)

Effects On Payments Proximate To Minimum Payment Amount

50% Payment Option Makes Consumers Initially Less Likely To Pay In Full

50% Payment Option Makes Consumers Initially Less Likely To Pay In Full

δ_6^k (percentage points):

T1 (vs C) 0.94 (s.e. 0.54)
T2 (vs C) -1.93^{***} (s.e. 0.24)
T1 (vs T2) 2.87^{***} (s.e. 0.52)
(C mean: 1.9%)

T1 (vs C) -2.44 (s.e. 1.25)
T2 (vs C) 0.72 (s.e. 1.23)
T1 (vs T2) -1.72 (s.e. 1.57)
(C mean: 18.2%)

No Evidence Of Shrouding Minimum Payment Causes Payments To Increase

Adding 50% option:

↓ $Pr(\text{Payment} \in \{(30\%, 45\%], 100\%\})$

↑ $Pr(\text{Payment} \in \{(45\%, 55\%]\})$

Clickstream Data: Shrouding Minimum Lowers Initial Payment Choice

CDFs Of Initial Vs. Last Payment Choices Within Payment Cycle

Pr (Initial Payment Choice < Minimum Payment):

T1 (vs C) 19.44*** (s.e. 1.16) T2 (vs C) 30.50*** (s.e. 1.02)

T1 (vs T2) 11.06*** (s.e. 1.38) (percentage points, C mean: 33.7%)

3. Heterogeneity, Distinguishing Anchoring from Targeting

Examine 3 Sources of Heterogeneity (Calculated With Pre-Experiment Data)

1. Liquid Cash
2. Credit Card Utilization
3. (Near Minimum Payers)

Minimum liquid cash balance in 90 days pre-experiment:

- <\$1 for 63% cardholders
- <\$501 for 93% cardholders
- <\$1,001 for 96% cardholders

Minimum liquid cash balance in 90 days pre-experiment:

- <\$1 for 63% cardholders
- <\$501 for 93% cardholders
- <\$1,001 for 96% cardholders

Not sample-specific: Similar for cardholders at large U.K. bank
(Guttman-Kenney et al., 2025)

Heterogeneous Effects By Pre-Trial Liquid Cash Balances

Sample	T1 (vs C) (1)	T2 (vs C) (2)	T1 (vs T2) (3)	Consumers
Liquid Cash <\$1	1.32 (2.28)	1.01 (2.22)	0.31 (2.97)	1,025
Liquid Cash \$1+	-1.36 (0.88)	0.20 (0.86)	-1.56 (1.10)	5,689
Liquid Cash <\$501	-0.46 (1.06)	0.70 (1.06)	-1.16 (1.34)	3,796
Liquid Cash \$501+	-0.80 (1.3)	-0.45 (1.23)	-0.35 (1.60)	2,918
Liquid Cash <\$1,001	-1.11 (0.95)	0.42 (0.95)	-1.53 (1.21)	4,726
Liquid Cash \$1,001+	0.25 (1.58)	-0.22 (1.50)	0.47 (1.96)	1,988
Minimum Liquid Cash <\$1	-1.47 (1.02)	0.68 (1.03)	-2.15 (1.31)	4,230
Minimum Liquid Cash \$1+	-0.25 (1.37)	-0.15 (1.33)	-0.09 (1.70)	2,484
Minimum Liquid Cash <\$501	-0.88 (0.83)	0.61 (0.83)	-1.49 (1.06)	6,252

Time F.E.	X	X	X	
Consumer Controls	X	X	X	

Side Quest: Empirical Support For New Macroeconomic Modeling Approach

- Heterogeneous agent models (“HANK”) include hand-to-mouth consumers with zero liquid wealth **experiencing binding borrowing constraints** (Kaplan & Violante, 2022)
- Lee & Maxted (2025): **binding borrowing constraints inconsistent with SCF data**
 - Consumers often borrow intermediate levels of credit card debt

Side Quest: Empirical Support For New Macroeconomic Modeling Approach

- Heterogeneous agent models (“HANK”) include hand-to-mouth consumers with zero liquid wealth **experiencing binding borrowing constraints** (Kaplan & Violante, 2022)
- Lee & Maxted (2025): **binding borrowing constraints inconsistent with SCF data**
 - Consumers often borrow intermediate levels of credit card debt
- Are Lee & Maxted (2025)’s results due to under-reporting of credit card debt in SCF?(Zinman, 2009) **No!**
 - I also find cardholders with low liquid cash are not borrowing constrained
- My empirical support for Lee and Maxted (2025)’s theory has broad implications,
 - Affects how households respond to fiscal and monetary policy

Distinguishing Anchoring from Targeting

Distinguishing Anchoring from Targeting

Anchors: Irrelevant numbers influence choices e.g., thinking of your (randomly-assigned) last two digits of SSN influences choices (Tversky & Kahneman, 1974; Ariely et al., 2003)

Targets (reference-dependent preferences): Consumers exert effort to meet/exceed relevant numbers e.g., marathon time goals (Heath, Larrick, & Wu, 1999; Allen et al., 2017)

Distinguishing Anchoring from Targeting

Anchors: Irrelevant numbers influence choices e.g., thinking of your (randomly-assigned) last two digits of SSN influences choices (Tversky & Kahneman, 1974; Ariely et al., 2003)

Targets (reference-dependent preferences): Consumers exert effort to meet/exceed relevant numbers e.g., marathon time goals (Heath, Larrick, & Wu, 1999; Allen et al., 2017)

Distinguish using **“VPA” Value Proximity Analysis** (Bartels, Herzog, & Sussman, 2024)

$$Y_i = \frac{1}{N_i} \sum_{j \in S_i} 1(V_j \geq F)$$

$$Y_i = \alpha + \beta^{T1} T1_i + \beta^{T2} T2_i + \gamma Proximity_i + \theta^{T1} (Proximity_i \times T1) + \theta^{T2} (Proximity_i \times T2) + \varepsilon_i$$

Distinguishing Anchoring from Targeting

Anchors: Irrelevant numbers influence choices e.g., thinking of your (randomly-assigned) last two digits of SSN influences choices (Tversky & Kahneman, 1974; Ariely et al., 2003)

Targets (reference-dependent preferences): Consumers exert effort to meet/exceed relevant numbers e.g., marathon time goals (Heath, Larrick, & Wu, 1999; Allen et al., 2017)

Distinguish using “**VPA**” **Value Proximity Analysis** (Bartels, Herzog, & Sussman, 2024)

$$Y_i = \frac{1}{N_i} \sum_{j \in S_i} 1(V_j \geq F)$$

$$Y_i = \alpha + \beta^{T1} T1_i + \beta^{T2} T2_i + \gamma Proximity_i + \theta^{T1} (Proximity_i \times T1) + \theta^{T2} (Proximity_i \times T2) + \varepsilon_i$$

VPA Predicts:

Anchoring: $\alpha \approx 50\%$ (symmetric), $\gamma > 0$ if low $\gamma < 0$ high anchor, $\beta^{T1}, \beta^{T2}, \theta^{T1}, \theta^{T2} \neq 0$

Targeting: $\alpha \approx 100\%$ (asymmetric), $\gamma < 0$, $\beta^{T1}, \beta^{T2}, \theta^{T1}, \theta^{T2} = 0$

VPA Results Inconsistent With Anchoring

Evidence Against Credit Card Anchoring

1. Shrouding minimum payment does not increase payments
2. Initial payment choices are lower when minimum payment is shrouded
3. Value Proximity Analysis results inconsistent with anchoring
4. Heterogeneity analysis shows no increase in payments for near minimum payers

(+ shrouding autopay minimum payment option also ineffective, Guttman-Kenney et al., 2025)

Evidence Against Credit Card Anchoring

1. Shrouding minimum payment does not increase payments
2. Initial payment choices are lower when minimum payment is shrouded
3. Value Proximity Analysis results inconsistent with anchoring
4. Heterogeneity analysis shows no increase in payments for near minimum payers

(+ shrouding autopay minimum payment option also ineffective, Guttman-Kenney et al., 2025)

Instead, makes sense for cardholders to target minimum payment, given frequently low liquid cash balances & discontinuity in economic payoffs generating observed bunching in payments

“An issue that has received relatively little attention in the literature is that kinks and notches may represent reference points” (Kleven, 2016)

Conclusions

Key Findings

- Shrouding the minimum payment does *not* increase in credit card payments
- Adding 50% payment option also does *not* increase credit card payments
- Credit cardholders frequently have low liquid cash balances (& not at borrowing constraint)

Key Findings

- Shrouding the minimum payment does *not* increase in credit card payments
- Adding 50% payment option also does *not* increase credit card payments
- Credit cardholders frequently have low liquid cash balances (& not at borrowing constraint)

Key Implications

- **Credit Cards:** Below prime credit cardholders frequently have low liquid cash balances.
 - Minimum payment amount is (relevant) target **not** (irrelevant) anchor
- **Behavioral Economics:** Consumers “hack” active choice nudge
- **Macroeconomic Models:** Hand-to-mouth consumers often not at borrowing constraint
- **Survey Methods:** Use online experiments with caution!

Thank you!

Pre-Experiment Controls

Linear controls:

- Age
- Credit Score
- Card Tenure
- Pre-experiment values of all of the primary and secondary outcomes
- Number of open credit cards held in their portfolio
- Total credit card portfolio balances
- Total credit card portfolio credit limits

Fixed effects:

- Interest rate
- Credit limit
- Autopay type

Primary and Secondary Outcomes

Primary Outcome: 1. Payments (%) = $\sum \text{Payments} / \text{Statement Balance}$)

Secondary Outcomes:

2. Payments (\$)
3. Statement Balance (\$)
4. Spending (\$)
5. Spending (%)
6. Revolving Debt (\$)
7. Credit Limit (\$)
8. Miss Pay (%)
9. Pay Min (%)
10. Pay 50% (%)
11. Pay Full (%)
12. Pay Current Balance (%)

Follow Keys & Wang (2019) Defining Near Minimum Payers 🚀

Anchoring predicts largest results for unconstrained cardholders “near minimum payers”:

$$payments \in \{(Minimum, Minimum + \$50] \setminus Full\}$$

18% my data, 20% in Keys & Wang (2019)

Follow Keys & Wang (2019) Defining Near Minimum Payers 📌

Anchoring predicts largest results for unconstrained cardholders “near minimum payers”:

$$\text{payments} \in \{(Minimum, Minimum + \$50] \setminus Full\}$$

18% my data, 20% in Keys & Wang (2019)

Sample	T1 (vs C) (1)	T2 (vs C) (2)	T1 (vs T2) (3)	Consumers
Near Minimum	2.89 (1.73)	-0.56 (1.54)	3.45 (2.07)	1,226
Not Near Minimum	-1.44 (0.92)	0.28 (0.92)	-1.72 (1.17)	5,488
Time F.E.	X	X	X	
Consumer Controls	X	X	X	

Example Histogram & VPA Charts in Bartels, Herzog, & Sussman (2024) 📍

Example Histograms and VPA Charts

Value Proximity Analysis (VPA): Payments Proximate To Focal Amounts

A. Minimum Payment

B. 50% Statement Balance

C. Statement Balance

Reconciling Results With Credit Card Literature 🍷

- Credit card behavior is difficult to shift.
- Understand why suggested payment amounts (e.g., 50%, CARD Act scenarios) ineffective.
 - Intermediate payment values struggle to compete with cardholders targeting paying at least the minimum and the full amount, where strong economic incentives exist.
- Understand why lenders set low minimum payments and why increases to minimum payments can reduce debt, in a way inconsistent with liquidity constraints.
