

Targeting Higher Credit Card Payments

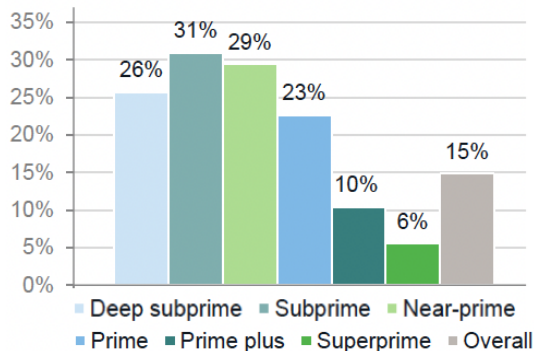

Benedict Guttman-Kenney

Rice University

Junior Household Finance Virtual Seminar, 18th June 2026

Credit Cardholders Often Only Pay The Minimum Payment Amount. Why?

% of credit card accounts paying the minimum payment amount, by credit score
(Consumer Financial Protection Bureau, 2025)

29% of accounts pay within \$50 of the minimum payment amount
(Keys & Wang, 2019 JFE)

One Potential Explanation: Anchoring Heuristic

Anchoring and adjustment heuristic: Foundational bias in Tversky & Kahneman (1974)

Key idea:

- Anchors: Salient but irrelevant numbers can bias consumer choices
e.g., randomly-assigned last two-digits of Social Security Number (Ariely et al., 2003)
- Consumers choose at / near the numerical amount initially presented
& adjust away too little

“One of the most robust phenomena studied across the social behavioral sciences”
– 50-year meta-analysis by Schley and Weingarten (2025)

Anchoring Influential In The Credit Card Literature

Research across the fields of economics, finance, management, marketing, and psychology attributes “**anchoring**” as an important determinant of consumer credit card payment choices:

- Credit card minimum payment “can serve as an anchor, and as a nudge that this minimum payment is an appropriate amount” (Sunstein & Thaler, 2008)

Anchoring Influential In The Credit Card Literature

Research across the fields of economics, finance, management, marketing, and psychology attributes “**anchoring**” as an important determinant of consumer credit card payment choices:

- Credit card minimum payment “can serve as an anchor, and as a nudge that this minimum payment is an appropriate amount” (Sunstein & Thaler, 2008)
- Shrouding minimum payment amount ↑ hypothetical credit card payments (Stewart, 2009)

Anchoring Influential In The Credit Card Literature

Research across the fields of economics, finance, management, marketing, and psychology attributes **“anchoring”** as an important determinant of consumer credit card payment choices:

- Credit card minimum payment “can serve as an anchor, and as a nudge that this minimum payment is an appropriate amount” (Sunstein & Thaler, 2008)
- Shrouding minimum payment amount ↑ hypothetical credit card payments (Stewart, 2009)
- Replicated across online experiments (Navarro-Martinez et al., 2011; Jiang & Dunn, 2013; Salisbury, 2014; McHugh & Ranyard, 2016; Guttman-Kenney et al., 2018; Salisbury & Zhao, 2020; Hendy et al., 2021; Sakaguchi et al., 2022; Ortiz et al., 2024; Durán-Micco et al., 2026; Incekara-Hafalir et al., 2026)

Anchoring Influential In The Credit Card Literature

Research across the fields of economics, finance, management, marketing, and psychology attributes “**anchoring**” as an important determinant of consumer credit card payment choices:

- Credit card minimum payment “can serve as an anchor, and as a nudge that this minimum payment is an appropriate amount” (Sunstein & Thaler, 2008)
- Shrouding minimum payment amount ↑ hypothetical credit card payments (Stewart, 2009)
- Replicated across online experiments (Navarro-Martinez et al., 2011; Jiang & Dunn, 2013; Salisbury, 2014; McHugh & Ranyard, 2016; Guttman-Kenney et al., 2018; Salisbury & Zhao, 2020; Hendy et al., 2021; Sakaguchi et al., 2022; Ortiz et al., 2024; Durán-Micco et al., 2026; Incekara-Hafalir et al., 2026)
- Some support in administrative data (Keys & Wang, 2019; Medina & Negrin, 2022; Vihriälä, 2025) but it does not explain autopay choices (Guttman-Kenney et al., 2025)

Anchoring Influential In The Credit Card Literature

Research across the fields of economics, finance, management, marketing, and psychology attributes “**anchoring**” as an important determinant of consumer credit card payment choices:

- Credit card minimum payment “can serve as an anchor, and as a nudge that this minimum payment is an appropriate amount” (Sunstein & Thaler, 2008)
- Shrouding minimum payment amount ↑ hypothetical credit card payments (Stewart, 2009)
- Replicated across online experiments (Navarro-Martinez et al., 2011; Jiang & Dunn, 2013; Salisbury, 2014; McHugh & Ranyard, 2016; Guttman-Kenney et al., 2018; Salisbury & Zhao, 2020; Hendy et al., 2021; Sakaguchi et al., 2022; Ortiz et al., 2024; Durán-Micco et al., 2026; Incekara-Hafalir et al., 2026)
- Some support in administrative data (Keys & Wang, 2019; Medina & Negrin, 2022; Vihriälä, 2025) but it does not explain autopay choices (Guttman-Kenney et al., 2025)

Key implication: Without anchoring, cardholders would ↑ credit card payments

This Paper: Do Online Experimental Findings Extrapolate To The Field?

Field experiment on 6,714 credit cardholders with a U.S. FinTech lender

- RCT that varies in-app (manual) credit card payment options for six statement cycles
 - Test shrouding minimum payment amount: Under anchoring, should $\uparrow$ payments
 - Test effects of 50% payment amount option
- Observe outcomes over six statement cycles

This Paper: Do Online Experimental Findings Extrapolate To The Field?

Field experiment on 6,714 credit cardholders with a U.S. FinTech lender

- RCT that varies in-app (manual) credit card payment options for six statement cycles
 - Test shrouding minimum payment amount: Under anchoring, should $\uparrow$ payments
 - Test effects of 50% payment amount option
- Observe outcomes over six statement cycles

Key Findings: Results of hypothetical online experiments do not translate into the field

- No increase in payments from shrouding the minimum payment
- Shrouding *lowers* initial payment choices: Opposite of what anchoring predicts
- 50% payment option also does not change payments

- Evidence that a **policy** shrouding the minimum payment is expected to be ineffective (Financial Conduct Authority, 2021; Brookings, 2022; Financial Health Network, 2023)

Contributions

- Evidence that a **policy** shrouding the minimum payment is expected to be ineffective (Financial Conduct Authority, 2021; Brookings, 2022; Financial Health Network, 2023)
- **Household Finance:** Understand why low-credit score credit cardholders often only pay at or just-above the minimum payment amount
 - *Not* driven by heuristic anchoring to the minimum payment
 - Cardholders frequently lack liquid cash, not at borrowing constraint

- Evidence that a **policy** shrouding the minimum payment is expected to be ineffective (Financial Conduct Authority, 2021; Brookings, 2022; Financial Health Network, 2023)
- **Household Finance:** Understand why low-credit score credit cardholders often only pay at or just-above the minimum payment amount
 - *Not* driven by heuristic anchoring to the minimum payment
 - Cardholders frequently lack liquid cash, not at borrowing constraint
 - Bunching makes sense given discontinuity in payoffs from paying at least the minimum
 - Consumers target paying at least the minimum payment, which acts as a reference point

Contributions

- Evidence that a **policy** shrouding the minimum payment is expected to be ineffective (Financial Conduct Authority, 2021; Brookings, 2022; Financial Health Network, 2023)
- **Household Finance:** Understand why low-credit score credit cardholders often only pay at or just-above the minimum payment amount
 - *Not* driven by heuristic anchoring to the minimum payment
 - Cardholders frequently lack liquid cash, not at borrowing constraint
 - Bunching makes sense given discontinuity in payoffs from paying at least the minimum
 - Consumers target paying at least the minimum payment, which acts as a reference point
- **Behavioral Economics:** Weakness of active choice nudges & anchoring heuristic

Contributions

Arro is a FinTech lender that provides credit cards in the United States:

- Means: \$290 credit limits, \$200 statement balance, 560 VantageScore
- Clearly not representative of broader credit card market!

Below-prime credit score (< 660 VantageScore) consumers:

- Highest interest rates and so the large potential gains from increasing payments (Drechsler et al., 2025; Consumer Financial Protection Bureau, 2025)
- Most likely to pay at or just-above the minimum payment amount and have similar “anchoring” estimates to prime consumers (Keys & Wang, 2019)

Arro is a FinTech lender that provides credit cards in the United States:

T2 (vs C): $\$8.79$ (s.e. \$5.14)

T1 (vs T2): $\$1.97$ (s.e. \$6.68)

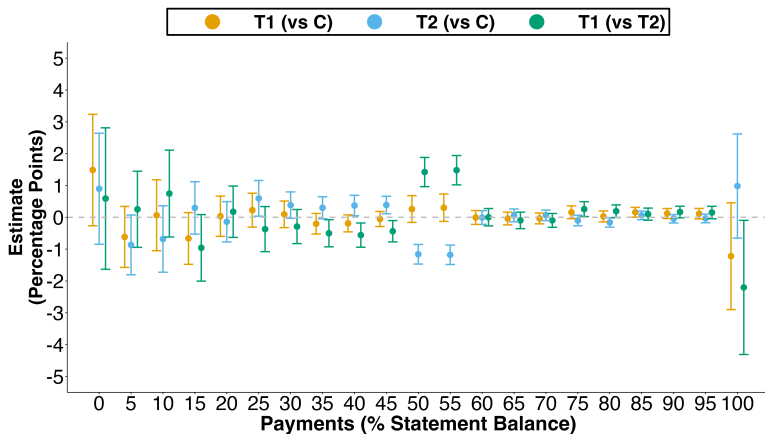

(C mean: \$230.9)

Limited Effects On The Distribution Of Payments (% Statement Balance)

T1 (vs T2): $\uparrow Pr(\text{Payment} \in \{(45\%, 55\%]\})$, $\downarrow Pr(\text{Payment} \in \{(30\%, 45\%], 100\%\})$

Limited Effects On The Distribution Of Payments (% Statement Balance)

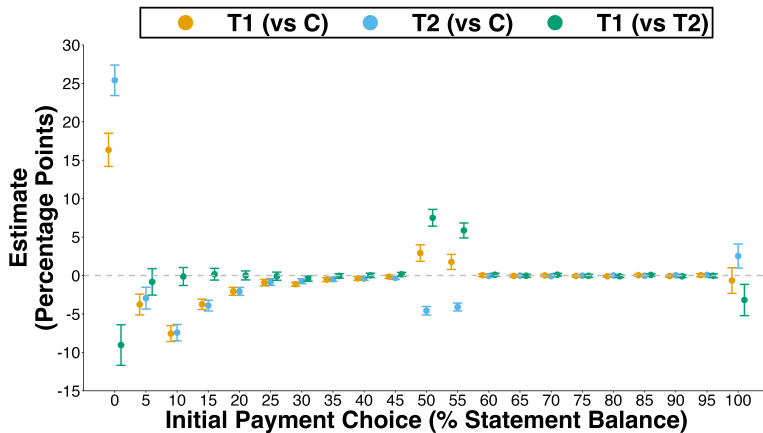

T1 (vs T2): $\uparrow Pr(\text{Payment} \in \{(45\%, 55\%]\})$, $\downarrow Pr(\text{Payment} \in \{(30\%, 45\%], 100\%\})$

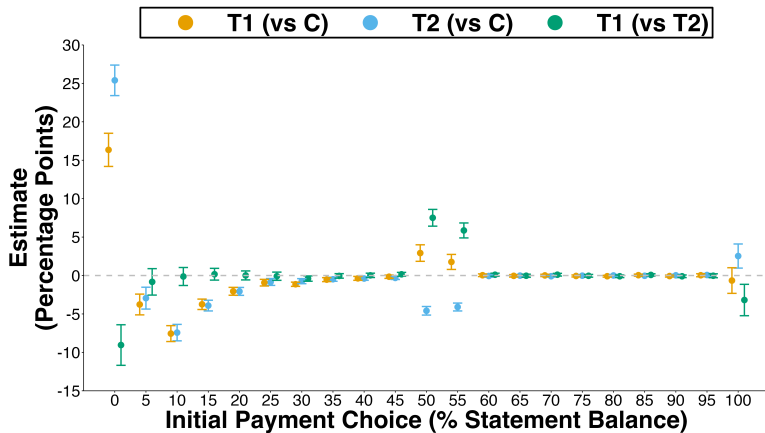

Shrouding minimum makes consumers more likely to pay small, round-numbered amounts
& less likely to pay multiples of the minimum payment

3. Mechanisms

Clickstream Data: Shrouding Minimum Lowers Initial Payment Choice

Clickstream Data: Shrouding Minimum Lowers Initial Payment Choice

Pr (Initial Payment Choice < Minimum Payment):

T1 (vs C) 19.44*** (s.e. 1.16) **T2 (vs C)** 30.50*** (s.e. 1.02)

T1 (vs T2) 11.06*** (s.e. 1.38) (percentage points, C mean: 33.7%)

Cardholders Not At Borrowing Constraints But Frequently Lack Liquid Cash

1. **Credit Card Portfolio Utilization (Equifax):** 25% (mean) & 36% (median)
 - Only 16% cardholders with 90%+ portfolio utilization
 - Typically not at borrowing constraint (inconsistent with liquidity constraints in HANK)
 - No significant heterogeneous effects for low-utilization consumers

Cardholders Not At Borrowing Constraints But Frequently Lack Liquid Cash

1. **Credit Card Portfolio Utilization (Equifax):** 25% (mean) & 36% (median)
 - Only 16% cardholders with 90%+ portfolio utilization
 - Typically not at borrowing constraint (inconsistent with liquidity constraints in HANK)
 - No significant heterogeneous effects for low-utilization consumers
2. **Liquid Cash (Plaid):** *Minimum* liquid cash balances in 90 days pre-experiment
 - 63% of cardholders have <\$1, 93% <\$501, 96% <\$1,001 minimum liquid cash balances
 - No significant heterogeneous effects by minimum liquid cash balances, however, cannot rule out meaningful positive/negative effects for \$1,001+ group ($N = 292$)
 - Similar pattern for large U.K. bank credit cardholders (Guttman-Kenney et al., 2025)

Cardholders Not At Borrowing Constraints But Frequently Lack Liquid Cash

1. **Credit Card Portfolio Utilization (Equifax):** 25% (mean) & 36% (median)
 - Only 16% cardholders with 90%+ portfolio utilization
 - Typically not at borrowing constraint (inconsistent with liquidity constraints in HANK)
 - No significant heterogeneous effects for low-utilization consumers
2. **Liquid Cash (Plaid):** *Minimum* liquid cash balances in 90 days pre-experiment
 - 63% of cardholders have <\$1, 93% <\$501, 96% <\$1,001 minimum liquid cash balances
 - No significant heterogeneous effects by minimum liquid cash balances, however, cannot rule out meaningful positive/negative effects for \$1,001+ group ($N = 292$)
 - Similar pattern for large U.K. bank credit cardholders (Guttman-Kenney et al., 2025)

My results support macroeconomic modeling approach of Lee & Maxted (2026), in which present bias jointly explains high MPCs & revolving modest credit card debt (Meier & Sprenger, 2010; Kuchler & Pagel, 2021; Laibson et al., 2026)

Understanding Credit Card Behaviors & Reconciling Literature

Bunching of credit card payments at/just-above minimum payment amount makes sense given:

- Cardholders frequently have low liquid cash balances
- Discontinuity in economic payoffs from paying at least minimum e.g., to avoid late fees

Instead of being an irrelevant number to anchor to, the **minimum payment amount appears to be a relevant target** for consumers to meet/exceed (Bartels, Herzog, & Sussman, 2024)

Understanding Credit Card Behaviors & Reconciling Literature

Bunching of credit card payments at/just-above minimum payment amount makes sense given:

- Cardholders frequently have low liquid cash balances
- Discontinuity in economic payoffs from paying at least minimum e.g., to avoid late fees

Instead of being an irrelevant number to anchor to, the **minimum payment amount appears to be a relevant target** for consumers to meet/exceed (Bartels, Herzog, & Sussman, 2024)

Reference-dependent preferences: Targeting to pay at least the minimum, and, if possible, pay their balance in full, can also help to understand other results in the credit card literature:

- Suggesting intermediate payment amounts, providing information disclosure or informational nudges on payment time/costs does not change debt (Agarwal et al., 2015; Keys & Wang, 2016; Seira et al., 2017; Adams et al., 2022)
- Increasing minimum payment requirements reduces debt of unconstrained cardholders (Keys & Wang, 2019; Medina & Negrin, 2022; Castellanos et al., 2025; Allen et al., 2026)

Key Findings

- No increase in payments from shrouding the minimum payment
- Shrouding *lowers* initial payment choices: Opposite of what anchoring predicts
- 50% payment option also does not change payments

Key Findings

- No increase in payments from shrouding the minimum payment
- Shrouding *lowers* initial payment choices: Opposite of what anchoring predicts
- 50% payment option also does not change payments

Understand why low credit score credit cardholders

often only pay at or just-above the minimum payment amount:

- Cardholders frequently have low liquid cash balances (and are at not borrowing constraint)
- Minimum payment amount is a (relevant) target **not** an (irrelevant) anchor

Thank you!

benedictgk@rice.edu

Contribution Relative to Guttman-Kenney, Adams, Laibson, Stewart, & Leary (2025)

Results are consistent, despite different treatments and populations

1. Shroud minimum payment in manual payment vs. shrouding autopay minimum at card opening
2. Even without offsetting responses found in my earlier paper (autopay enrollment, offsetting higher autopay with lower manual payments), shrouding remains ineffective
3. Test a new intermediate payment option: 50% of the statement balance
4. **Most importantly, the data and research design allow me to pin down the economics and psychology behind credit card payment decisions**

Pre-Experiment Controls

Linear controls:

- Age
- Credit Score
- Card Tenure
- Pre-experiment values of all of the primary and secondary outcomes
- Number of open credit cards held in their portfolio
- Total credit card portfolio balances
- Total credit card portfolio credit limits

Fixed effects:

- Interest rate
- Credit limit
- Autopay type

Primary and Secondary Outcomes

Primary Outcome: 1. Payments (%) = $\sum \text{Payments} / \text{Statement Balance}$)

Secondary Outcomes:

2. Payments (\$)
3. Statement Balance (\$)
4. Spending (\$)
5. Spending (%)
6. Revolving Debt (\$)
7. Credit Limit (\$)
8. Miss Pay (%)
9. Pay Min (%)
10. Pay 50% (%)
11. Pay Full (%)
12. Pay Current Balance (%)

Attrition (3, 6 Cycles)

Empirical Support For New Macroeconomic Modeling Approach

- Heterogeneous agent models (“HANK”) include hand-to-mouth consumers with zero liquid wealth **experiencing binding borrowing constraints** (Kaplan & Violante, 2022)
- Lee & Maxted (2026): **binding borrowing constraints inconsistent with SCF data**
 - Consumers often borrow intermediate levels of credit card debt
 - This result could be driven by under-reporting of credit card debt in SCF (Zinman, 2009)
- I also find cardholders with low liquid cash are not borrowing constrained
- My empirical support for Lee and Maxted (2026)’s theory has broad implications
 - Affects how households respond to fiscal and monetary policy

Follow Keys & Wang (2019) Defining Near Minimum Payers 🚀

Anchoring predicts largest results for unconstrained cardholders “near minimum payers”:

$$payments \in \{(Minimum, Minimum + \$50] \setminus Full\}$$

18% my data, 20% in Keys & Wang (2019)

Follow Keys & Wang (2019) Defining Near Minimum Payers 📌

Anchoring predicts largest results for unconstrained cardholders “near minimum payers”:

$$\text{payments} \in \{(Minimum, Minimum + \$50] \setminus Full\}$$

18% my data, 20% in Keys & Wang (2019)

Sample	T1 (vs C) (1)	T2 (vs C) (2)	T1 (vs T2) (3)	Consumers
Near-Minimum	2.89 (1.73)	-0.56 (1.54)	3.45 (2.07)	1,226
Not-Near-Minimum	-1.44 (0.92)	0.28 (0.92)	-1.72 (1.17)	5,488

Distinguishing Anchoring from Targeting

Anchors: *Irrelevant* numbers influence choices e.g., thinking of your (randomly-assigned) last two digits of SSN influences choices (Tversky & Kahneman, 1974; Ariely et al., 2003)

Targets (reference-dependent preferences): Consumers exert effort to meet/exceed *relevant* numbers e.g., marathon time goals (Heath, Larrick, & Wu, 1999; Allen et al., 2017)

Distinguishing Anchoring from Targeting

Anchors: *Irrelevant* numbers influence choices e.g., thinking of your (randomly-assigned) last two digits of SSN influences choices (Tversky & Kahneman, 1974; Ariely et al., 2003)

Targets (reference-dependent preferences): Consumers exert effort to meet/exceed *relevant* numbers e.g., marathon time goals (Heath, Larrick, & Wu, 1999; Allen et al., 2017)

Distinguish using **“VPA” Value Proximity Analysis** (Bartels, Herzog, & Sussman, 2024)

VPA Predicts:

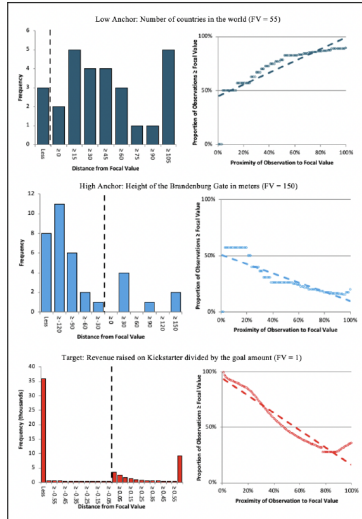

Anchoring: $\alpha \approx 50\%$ (symmetric), $\gamma > 0$ if low anchor ($\gamma < 0$ if high), $\beta^{T1}, \beta^{T2}, \theta^{T1}, \theta^{T2} \neq 0$

Targeting: $\alpha \approx 100\%$ (asymmetric), $\gamma < 0$, $\beta^{T1}, \beta^{T2}, \theta^{T1}, \theta^{T2} = 0$

$$P(Y_w \geq F) = \alpha + \beta^{T1} T1_w + \beta^{T2} T2_w \\ + \gamma Proximity_w + \theta^{T1} (Proximity_w \times T1) + \theta^{T2} (Proximity_w \times T2) + \varepsilon_w$$
